1. ICHOM

2. Using the results to improve the sector
The International Consortium for Measuring Health Outcomes (ICHOM) promotes the concept of Value Based Healthcare (VBHC) based on a standardized measurement of information that constitutes Standard Sets.

Anahp's ICHOM project consists of assisting the associated hospitals in the implementation, measurement and benchmarking of these standardized questionnaires.
Measuring with the ICHOM Standard Sets means obtaining results of clinical outcomes from the patient's perspective. For hospitals, measuring such outcomes serves a variety of purposes: building a knowledge base, improving performance, demonstrating superior performance, and enabling value-based payment models.
The dynamics and flows

- 8 Anahp’s members started this journey in 2017.

Methodology of implementation:
- Gap analysis
- Process map
- Internal Simulation
- Pilot project
The contacts with the patient occur with the periodicity recommended by ICHOM.
Group Discussions

- Definition of criteria for inclusion and exclusion of patients
- Definitions about peculiarities of Brazil and relevant information
- Definitions of the method of contact with the patient
- National benchmarking
- Best practices
Anahp provides data entry and benchmarking in a computerized way via the SINHA platform.
USING THE RESULTS FOR SECTOR IMPROVEMENT
Outliers exist in all areas of medicine

Over time, we expect variation to narrow and performance to improve globally

Mean change in ODI
